New UAE Fire Code requires firestopping in Chapter 7, Section 21.

Abu Dhabi Building Code is based on IBC and requires Firestopping in Chapter 7.

Approved Standards For Inspection:

- ASTM E 2174 (through Penetrations)
- ASTM 2393 (Joints and Curtain Wall)
The UAE Code requires testing of the CW Firestop designs to the proper standards.

21.5.4. Perimeter fire barriers / External Curtainwall system

21.5.4.1. This category addresses any gap, joint, or opening, whether static or dynamic, between a fire rated floor assembly and a non-rated exterior wall assembly.

21.5.4.2. Exterior curtain wall and perimeter joints shall be intended to restrict the interior vertical passage of flame and hot gases from one floor to another at the location where the floor intersects the inside of an exterior curtain wall assembly.

21.5.4.3. A single or combination of materials used to create a firestop assembly at the perimeter gap between a fire resistance rated floor assembly and a non-resistance rated wall assembly, capable of preventing the spread of heat, fire, gases, smoke or other defined hazards through the opening in the wall and floor assembly.

Perimeter Fire Barrier System Ratings shall be established in accordance with ASTM E 2307 as the test method (Please refer to section 21.16 for acceptable alternative Test Standards).

STI has invested heavily in Curtain Wall testing:

- UL is the premier fire testing lab in the US
- STI tests mostly at UL
- STI designed and tested the first C.W. System with vision glass
- STI has more UL C.W. tests than all other competitors combined! (93 out of 123)*

As a result, STI has privileged working relationships with major C.W. designers/engineers around the world

Understanding the UL Directory Numbering System

**F. Spandrel Panel Parimeter Angles**
- Nom: 1-1/2 by 1-1/2 in. (38 by 38 mm) No. 22 gauge (0.031 in. or 0.79 mm thick) galvanized steel angles installed around entire perimeter of each spandrel panel. Angles recessed from interior face of framing as necessary to accommodate thickness of curtain wall insulation (item 2G). Angles cut to discontinuity at mullion mounting clips (item 2A). Angles screwed to mullions and transom along side and top of spandrel panel (item 1) and bottom margin 1/2 in. (13 mm) long self-drilling, self-tapping steel screws spaced max 12 in. (305 mm) OC. Angle along bottom of each spandrel panel to be screwed or nailed to leg of angle on mullion at each end and without any direct attachment of framing. At mullion mounting clips, a length of steel angle shall be installed to bridge between the perimeter angles over the mullion mounting clip. The "bridge" shall be cut at approx 45° (152°) longer than the clear space between angles and shall be secured to the perimeter angles with one No. 8 by 1 in. (25)

**F. Stiffener Tee**
- Two nominal 1-1/2 by 1-1/2 in. (38 by 38 mm) No. 20 gauge (0.038 in. or 0.93 mm thick) galvanized steel angles secured together, back to back, to form stiffener tee for installation in each horizontal seam of the curtain wall insulation (item 2E). The angle legs forming the stem of the tee shall be secured together using No. 8 by 1 in. (13 mm) long self-drilling, self-tapping steel screws spaced max 8 in. (203 mm) OC. The tee shall be installed with a clearance of 3/8 to 1/4 in. (0.8 to 0.6 mm) at each end and shall be screwed or nailed to the spandrel panel parimeter angles at locations 10 by 1/4 in. (19 mm) long self-drilling, self-tapping steel screws, with steel washers, through two predrilled 1/4 in. (6 mm) diameter holes at each end. One stiffener tee shall be located below its stem at an elevation 2 in. (51 mm) below the top plane of the floor at each level

**G. Curtain Wall Insulation**
- Min 2 in. (51 mm) thick mineral wool batt insulation faced on one side with aluminum foil/silica vapor retarder, supplied in min 36 in. (914 mm) wide rolls. Insulation batts to be installed with no vertical seams. Insulation panels tightly fit between vertical mullions and between the stem of the stiffener tee (item 2F) and the transom, flush with the interior surface of framing. Insulation panels secured to spandrel parimeter angles and to each stiffener tee with cup head weld pins (item 2J) or 4-1/2 in. (114 mm) long steel screws with min 1-1/2 in. (38 mm) diameter galvanized steel clinch shanks spaced max 12 in. (305 mm) OC. The horizontal seam between insulation panels shall be located 2 in. (51 mm) below the top plane of the floor at each level

**THERMAFIBER INC. - FIRESPAN 90**
- H. Framing Covers - Curtail Wall Insulation**
- Min 8 in. (204 mm) wide strips cut from the same 2 in. (51 mm) thick mineral wool batt insulation used for the curtain wall insulation (item 2G). Framing covers to be centered over mullions and secured to the spandrel parimeter angles with cup head weld pins (item 2J) or 4-1/2 in. (114 mm) long steel screws with min 1-1/2 in. (38 mm) diameter galvanized steel clinch shanks spaced max 12 in. (305 mm) OC. Where more than one spandrel panel (item 2C) occurs between vertically separated panels, the horizontal transom between spandrel panels shall also be covered with an 8 in. (204 mm) wide framing cover in the same manner as on the vertical mullions. Framing covers on mullions to stout the mineral wool batt safety material (item 2A) above and below floor

**THERMAFIBER INC. - FIRESPAN 90**
- I. Weld Pin - In lieu of steel screws, No. 12 gauge (2 mm diam) galvanized steel weld pins with min 3-1/4 in. (30 mm) diam galvanized steel cup head. Cup head weld pins provided in two lengths. One length to be equal to thickness of curtain wall insulation (item 2G) and second length to be equal to thickness of curtain wall insulation plus thickness of framing cover (item 2H). Cup head weld pins inserted through curtain wall insulation and mullion covers and welded to spandrel panel parimeter angles max 12 in. (305 mm) OC

**Light Gauge Framing**
- Spiral Anchor - (Not Shown) As an alternate to the weld pins (item 2J), galvanal steel wire spiral anchors may be used to secure the framing covers (item 2H) to the curtain wall insulation (item 2G) on each side of the mullion. Nominal length of spiral anchors to be equal to thickness of curtain wall insulation plus thickness of framing cover. Spiral anchors driven through mullion covers and into curtain wall insulation and spaced max 12 in. OC

**THERMAFIBER INC. - FIRESPAN 90**
- J. Safety System - Max separation between edge of floor assembly and face of framing members (at time of installation) is 8 in. (204 mm). The safety system is designed to accommodate vertical shear movement up to a max of 5 percent of its installed width. The safety system shall incorporate the following construction features:
  - A. Forelement Material - Nom 49 ft (14.9 kg/m) density mineral wool batt insulation. Batt sections out to a min 4 in. (102 mm) wide and slacked to a thickness which is min 25 percent greater than the width of linear gap between the curtain wall insulation and the edge of the concrete floor slab. The slacked forelement material is compressed 20 percent in the thickness direction and inserted edge-first into the liner gap such that the top surface is flush with the top surface of the floor assembly. A max of one tightly fitted seam to permit seams between mullions. Additions pieces of forelement material to be friction-fit into spaces between mullion mounting clips at each mullion location

**THERMAFIBER INC. - SAF**
- B. Fill, Void or Cavity Material**
- Min 18 in. (3 mm) wide thicknesses (min 11/16 in. or 1.6 mm dry thickness) of fill material spray-applied over top of framing material and tapping min 1/16 in. (1.6 mm) onto the top surface of the floor and onto the curtain wall insulation and framing covers

**SPECIFIED TECHNOLOGIES INC. - SpecSeal AS5200 Elastic密封 Spray or SpecSeal Fast Track Spray**
- Bearring the UL Classification Mark

---

1. **Floor Assembly** - Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 psi or 690-2650 kg/m³) structural concrete. Perimeter of floor assembly to be provided with min 3 by 11/4 in. (76 by 76 by 6 mm) thick cast-in-place structural steel angles for wall attachment of mullion mounting clips (item 2A).

2. **Curtain Wall Assembly** - The curtain wall assembly shall incorporate the following construction features:
   - A. Mullion Mounting Clips - Min 4 in. (102 mm) long angles with one nom 4 in. (102 mm) leg for attachment to edge of four assembly and each leg approx 4 in. (102 mm) longer than distance to nearest face of mullion. Clips to be flared out min 1/4 in. (6 mm) thick. Clips welded to steel angle at edge of assembly (item 1) on each side of vertical mullion (item 20) at each floor level. Each clip to be provided with elongated holes to accommodate approximate amount of movement. Top edge of each clip to be recessed min 1/2 in. (13 mm) below top surface of floor.
   - B. Framing - The rectangular tubing mullions (vertical members) and transoms (horizontal members) shall be min 2-1/2 in. (64 mm) wide X 2-1/2 in. (64 mm) deep and will be flared out min 0.295 in. (2.3 mm) thick aluminum. Mullions spaced max 60 in. (152 cm) OC and secured to mullion mounting clips (item 2A) at each floor level with two 3/8-16 by 4 in. (102 mm) long high strength steel bolts in conjunction with Steel nuts and washers. Interior face of mullions to be max 8 in. (204 mm) from edge of floor assembly. Transoms to be spaced min 36 in. (914 mm) OC. The minimum height from the top of the floor to the bottom of the top vision panel sill is 6 ft. (1829 mm)
   - C. Spandrel Panels - The spandrel panels shall consist of one of the following types:
     - a. Glass Panels - Nom 1/4 in. (6 mm) thick opaque heat-strengthened glass. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.
     - b. Aluminum Panels - Nom 1/8 in. (3 mm) thick aluminum panels with 1/14 in. (6 mm) thick edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.
     - c. Stone Panels - Nom 1-3/16 in. (46 mm) thick polished granite spandrel panels with 1 in. (25 mm) thick gauged edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.
     - d. Vision Panels - Nom 1/4 in. (6 mm) thick transparent heat-strengthened glass or nom 25 mm (0.98 in) thick insulated glass units with two layers of nom 1/4 in. (6 mm) thick transparent heat strengthened glass separated by a 1/2 in. (25 mm) air space. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.
CW-D-2042

First Two Alpha Characters “CW”

Identifies the gap between a fire rated floor and a non rated exterior curtain wall

Third Alpha Character is “S” or “D”

“S” Static Joints

“D” Dynamic Joints
CW-D-2042

Number Range = Max Clearance Distance Between Curtain Wall and Perimeter of Floor
0000-0999 = Less Than or Equal to 2"
1000-1999 = Greater than 2" - Less than = to 6"
2000-2999 = Greater than 6" - Less than = to 12"

CW-D-2042

Last Three Numeric Components = Test Number in the Series
Designates 042 as the 42nd test in the 2000-2999 PFCS series

Somerville, NJ 08876

Our Reference: File R14288
Subject: Engineering Studies for Perimeter Fire-Containment Systems

Dear Mr. Stahl:

This is to confirm our conversations regarding the Subject. It has come to our attention that engineering judgments for perimeter fire-containment systems incorporating steel back pans are being issued despite having no tested or listed designs for curtain walls with steel back pans to reference as the basis for such judgments.

Based on our previous testing experience, we have found that the steel back pan condition is a critical configuration from a fire test perspective. Testing conducted in accordance with ASTM E2307, Standard Test Method for Determining Fire Resistance of Perimeter Fire Barriers Using Intermediate-Scale, Multi-story Test Apparatus, has demonstrated that the thermal expansion of the steel pan can cause it to distort and deflect, stressing the perimeter fire containment system under fire conditions and in some cases causing the perimeter containment system to become dislodged. The fill material applied over the safing system in the perimeter fire-containment system can also be exposed to a significant amount of heat from the steel back pan and could cause ignition of sealants or coatings during the course of fire exposure.

UL has several published designs for steel back pan curtain wall conditions listed in the Fire Resistance Directory. Such published designs diminish the need for engineering judgments for this common yet critical condition.

Should you need any further assistance, please do not hesitate to contact us.

Very truly yours,

STEVEN J. HOFFMAN

Reverse Back-Pan (Shadow Box) Spandrel Panel CW-D-1009

- Perimeter Angles
- Stiff-Back Angle
- Shadow Box
In rated construction, all floors are rated.

The safing slot must be sealed in a manner that extends this rating to the exterior wall surface.
Mineral Wool Installation

Safing is cut slightly oversized and jam fit into the opening foil side up with the grain parallel to the floor.

Z shaped steel safing clips are used to impale the safing and suspend it into the opening.
...Do not adequately protect the safing slot!

 Sealant Installation

Two caulk beads are applied to seal the edges of the foil facing to the adjacent surfaces.
Do not adequately protect the safing slot!

In a Fire...
The insulation is oriented improperly... It lacks resilience and will not rebound.

As it burns, the edges shrink inward creating gaps.
Take advantage of Mineral Wool’s natural resilience to help keep the slot closed during a fire!

Mineral wool safining is oriented with its grain running vertically.
Use Proper Orientation and Compression

Providing maximum compression and extension and a tight fit against the spandrel insulation without the need for safing clips!

Assuring a tighter smoke, gas, and fire seal!
It is simple and easy to do!
Benefits of Pro-Actively Designing the Safing Slot

- Maintains compartmentation
- Prevents the migration of smoke through to floors above.
- Buys time for occupants to escape.
- Provides additional protection in the event of a sprinkler failure.
Today we will cover...

1. What is Curtain Wall Firestopping?

Steps to Inspect Perimeter Fire Barrier Firestop

Step 1: Verify Documents and submitted Drawings reference Legitimate Perimeter Fire Barrier Systems such as UL. CW-S or CW-D.

Step 2: Verify the Rating of the System is Greater than or equal to the rating of the floor.

Step 3: Verify Firestop material to be used and listed for use in Perimeter Fire Barrier Systems.

Step 4: Verify Documents reference systems that have been tested with windows or vision glass if the building has glazing close to the safing area.

Step 5: verify Stiff steel reinforcement member, if required, has been placed behind exposed curtain wall panel insulation.
Step 6: verify Insulation and brand used is listed within the tested system. Rock wool is the typical insulation of choice.

- Glass Melts
- Aluminum Melts

Fiberglass Insulation Fails (6 Minutes) at 1050 °F and is not to be used in a fire containment assembly.
Step 7: Verify Insulation panels are securely fastened with mechanical fasteners per the system, instead of just friction-fitted in place.

Step 8: Verify the exposed mullions, if required by the system are covered with the proper insulating barrier securely fastened with mechanical fasteners per the system design.

Step 9: Verify safing clips have been used if the system requires it.

Step 10: Verify Sealant is applied to the proper depth

Step 11: Verify the Parameters indicated in the system are the same as those installed in the field.
The IFC has put out a “Firestopping Inspection Manual” to help field inspectors.
In Conclusion

Thanks
